

A scatter plot showing two classes of data points: cyan circles (top) and magenta circles (bottom). A solid green line represents a linear decision boundary, with labels  $-1.000$  and  $1.000$  indicating the margins. Two curved green lines represent a non-linear model's decision boundary, which better separates the two classes. The plot illustrates the concept of a non-linear decision boundary in a 2D space.
